

Database Design Project

Oracle Baseball League Store Database

Project Scenario:

You are a small consulting company specializing in database development. You have just been awarded the contract to develop a data model for a database application system for a small retail store called Oracle Baseball League (OBL).

The Oracle Baseball League store serves the entire surrounding community selling baseball kit. The OBL has two types of customer, there are individuals who purchase items like balls, cleats, gloves, shirts, screen printed t-shirts, and shorts. Additionally customers can represent a team when they purchase uniforms and equipment on behalf of the team.

Teams and individual customers are free to purchase any item from the inventory list, but teams get a discount on the list price depending on the number of players. When a customer places an order we record the order items for that order in our database.

OBL has a team of three sales representatives that officially only call on teams but have been known to handle individual customer complaints.

Section 6 Lesson 9 Exercise 1: Joining Tables Using JOIN

Write SELECT Statements Using Data From Multiple Tables Using Equijoins and Non-Equijoins (S6L9 Objective 1)

In this exercise you will write SELECT statements to access data from more than one table.

Part 1: Creating Natural Joins.

1. Display all of the information about sales representatives and their addresses using a natural join.

```
SELECT id, email, first_name, last_name, phone_number, commission_rate, supervisor_id, address_line_1,
address_line_2, city, zip_code
FROM sales_representatives NATURAL JOIN sales_rep_addresses;
```

2. Adapt the query from the previous question to only show the id, first name, last name, address line 1, address line 2, city, email and phone_number for the sales representatives.

```
SELECT id, email, first_name, last_name, phone_number, address_line_1, address_line_2, city
FROM sales_representatives NATURAL JOIN sales_rep_addresses;
```

Part 2: Creating Joins with the USING Clause

1. Adapt the previous query answer to use the USING clause instead of a natural join.

```
SELECT id, email, first_name, last_name, phone_number, address_line_1, address_line_2, city
FROM sales_representatives JOIN sales_rep_addresses
USING (id);
```

2. Display all of the information about items and their price history by joining the items and price_history tables.

```
SELECT *
FROM items JOIN price_history
USING (itm_number);
```

Part 3: Creating Joins with the ON Clause

1. Use an ON clause to join the customer and sales representative table so that you display the customer number, customer first name, customer last name, customer phone number, customer email, sales representative id, sales representative first name, sales representative last name and sales representative email. You will need to use a table alias in your answer as both tables have columns with the same name.

```
SELECT c.ctr_number, c.first_name, c.last_name, c.phone_number, c.email, s.id, s.first_name, s.last_name,
s.email
FROM customers c JOIN sales_representatives s
ON (c.sre_id = s.id);
```

Part 4- Creating Three-Way Joins with the ON Clause

1. Using the answer to Task 3 add a join that will allow the team name that the customer represents to be included in the results.

```
SELECT c.ctr_number, c.first_name, c.last_name, c.phone_number, c.email, s.id, s.first_name, s.last_name,
s.email, t.name
FROM customers c JOIN sales_representatives s
ON (c.sre_id = s.id)
JOIN teams t
ON (t.id = c.tem_id);
```

Part 5: Applying Additional Conditions to a Join

1. Using the answer to Task 4 add an additional condition to only show the results for the customer that has the number - c00001.

```
SELECT c.ctr_number, c.first_name, c.last_name, c.phone_number, c.email, s.id, s.first_name, s.last_name,  
s.email, t.name  
FROM customers c JOIN sales_representatives s  
ON (c.sre_id = s.id)  
JOIN teams t  
ON (t.id = c.tem_id)  
AND c.ctr_number = 'c00001';
```

Part 6: Retrieving Records with Nonequi Joins

1. Write a query that will display name and cost of the item with the number im01101045 on the 12th of December 2016. The output of the query should look like this:

The cost of the under shirt on this day was 14.99

```
SELECT 'The cost of the ' || i.name || ' on this day was ' || p.price  
FROM items i JOIN price_history p  
ON (i.itm_number = p.itm_number)  
AND (TO_DATE('12-Dec-2016', 'DD-MM-YYYY') BETWEEN p.start_date AND p.end_date);
```

Database Design Project

Oracle Baseball League Store Database

Project Scenario:

You are a small consulting company specializing in database development. You have just been awarded the contract to develop a data model for a database application system for a small retail store called Oracle Baseball League (OBL).

The Oracle Baseball League store serves the entire surrounding community selling baseball kit. The OBL has two types of customer, there are individuals who purchase items like balls, cleats, gloves, shirts, screen printed t-shirts, and shorts. Additionally customers can represent a team when they purchase uniforms and equipment on behalf of the team.

Teams and individual customers are free to purchase any item from the inventory list, but teams get a discount on the list price depending on the number of players. When a customer places an order we record the order items for that order in our database.

OBL has a team of three sales representatives that officially only call on teams but have been known to handle individual customer complaints.

Section 6 Lesson 9 Exercise 2: Joining Tables Using JOIN

Write SELECT Statements Using Data From Multiple Tables Using Equijoins and Non-Equijoins (S6L9 Objective 1)

Part 1 : Use a Self-Join to Join a Table to Itself (S6L9 Objective 2)

1. Write a query that will display who the supervisor is for each of the sales representatives. The information should be displayed in two columns, the first column will be the first name and last name of the sales representative and the second will be the first name and last name of the supervisor. The column aliases should be Rep and Supervisor.

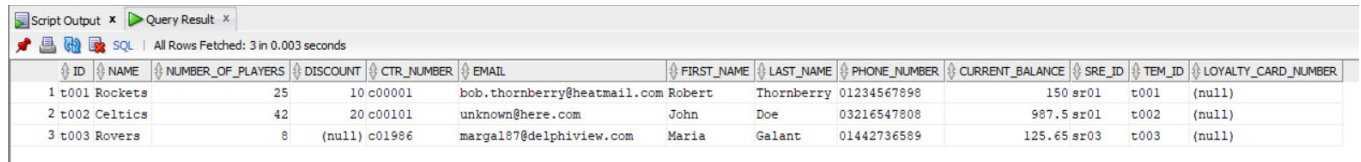

```
SELECT rep.first_name || ' ' || rep.last_name AS Rep, super.first_name || ' ' || super.last_name Supervisor
FROM sales_representatives rep JOIN sales_representatives super
ON (rep.supervisor_id = super.id);
```

	REP	SUPERVISOR
1	Charles Raymond	Charles Raymond
2	Victoria Wright	Charles Raymond
3	Barry Speed	Charles Raymond

Part 2 : Use OUTER joins (S6L9 Objective 3)

1. Write a query that will display all of the team and customer information even if there is no match with the table on the left (team).

```
SELECT *  
FROM teams LEFT OUTER JOIN customers  
ON (id = tem_id);
```

The screenshot shows a SQL query result in a table with 13 columns: ID, NAME, NUMBER_OF_PLAYERS, DISCOUNT, CTR_NUMBER, EMAIL, FIRST_NAME, LAST_NAME, PHONE_NUMBER, CURRENT_BALANCE, SRE_ID, TEM_ID, and LOYALTY_CARD_NUMBER. The table contains 3 rows of data, representing a LEFT OUTER JOIN between teams and customers. The first row shows team 't001 Rockets' with customer 'Robert Thornberry'. The second row shows team 't002 Celtics' with customer 'John Doe'. The third row shows team 't003 Rovers' with customer 'Maria Galant'.

ID	NAME	NUMBER_OF_PLAYERS	DISCOUNT	CTR_NUMBER	EMAIL	FIRST_NAME	LAST_NAME	PHONE_NUMBER	CURRENT_BALANCE	SRE_ID	TEM_ID	LOYALTY_CARD_NUMBER
1 t001	Rockets	25	10	c00001	bob.thornberry@heatmail.com	Robert	Thornberry	01234567898	150	sr01	t001	(null)
2 t002	Celtics	42	20	c00101	unknown@here.com	John	Doe	03216547808	987.5	sr01	t002	(null)
3 t003	Rovers	8	(null)	c01986	margal87@delphiview.com	Maria	Galant	01442736589	125.65	sr03	t003	(null)

Part 3 : Generating a Cartesian Product (S6L9 Objective 4)

1. Create a Cartesian product between the customer and sales representative tables.

```
SELECT *  
FROM customers  
CROSS JOIN sales_representatives;
```

(gambar output terlalu besar utk diskринshot)
